UK's largest supplier of road fuels and biofuel chooses Ecometrica to complete its carbon assessment for 2010

Greenergy International Ltd. is a London-based fuel company that supplies around one-fifth of the UK's road fuel, as well as being the country's principal supplier of biofuel. Greenergy sells about 175 million litres of fuel in the UK every week – enough to fill nearly 700 trucks per day, with customers including the major oil companies and supermarkets (diesel and petrol for retail sale and biofuel for onward blending), as well as bus and logistics companies (diesel for fleet use).

In June 2010, Ecometrica worked with Greenergy to quantify the greenhouse gas emissions associated with their operations for the financial year 2009/10.

Ecometrica quantified Greenergy's emissions from its fuel supply and distribution network, including the UK's largest biofuel plant, as well as traditional office-based activity and business travel. Ecometrica supported Greenergy throughout the process, helping them to define what needed to be included in the scope of their assessment, and how to collect the necessary data.

The results of the assessment were presented in a transparent and clear format using the Ecometrica Platform's full sustainability suite. This provided Greenergy with the information necessary to understand and manage the GHG emissions associated with their operations.

"Ecometrica helped us to understand what we needed to include in our GHG emissions assessment, and they assisted us throughout the process. Our results are presented in a format that is easy to understand and useful to us. Working with Ecometrica, we were able to complete the whole process in only 3 weeks."
